

Ayham Alajdad

#### **LEARNING OBJECTIVES**

- Define data modeling and simple linear regression
- Build a linear regression model using a dataset that meets the linearity assumption using the sci-kit learn library
- Understand and identify multicollinearity in a multiple regression.

### PRE-WORK

#### PRE-WORK REVIEW

- □Effectively show correlations between an independent variable x and a dependent variable y
- ☐ Be familiar with the get\_dummies function in pandas
- Understand the difference between vectors, matrices, Series, and
   DataFrames
- Understand the concepts of outliers and distance.
- Be able to interpret p values and confidence intervals

#### **OPENING**

# INTRODUCTION TO REGRESSION ANALYSIS

#### WHERE ARE WE IN THE DATA SCIENCE WORKFLOW?

- Data has been acquired and parsed.
- Today we'll refine the data and build models.
- We'll also use plots to represent the results.

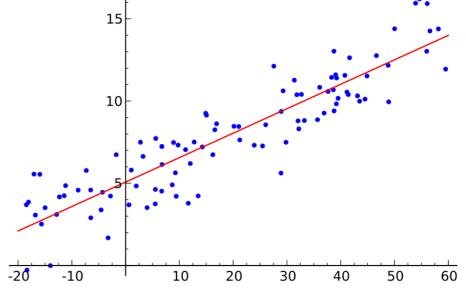

#### INTRODUCTION

## SIMPLE LINEAR REGRESSION

#### SIMPLE LINEAR REGRESSION

• Def: Explanation of a continuous variable given a series of independent variables

- The simplest version is just a line of best fit: y = mx + b
- Explain the relationship between **x** and **y** using the starting point **b** and the power in explanation **m**.

#### SIMPLE LINEAR REGRESSION

- However, linear regression uses linear algebra to explain the relationship between *multiple* x's and y.
- The more sophisticated version: y = beta \* X + alpha (+ error)
- Explain the relationship between the matrix **X** and a dependent vector **y** using a y-intercept **alpha** and the relative coefficients **beta**.

#### SIMPLE LINEAR REGRESSION

- Linear regression works best when:
  - The data is normally distributed (but doesn't have to be)
  - -X's significantly explain y (have low p-values)
  - •X's are independent of each other (low multicollinearity)
  - •Resulting values pass linear assumption (depends upon problem)
- If data is not normally distributed, we could introduce bias.

# REGRESSING AND NORMAL DISTRIBUTIONS

#### **DEMO: REGRESSING AND NORMAL DISTRIBUTIONS**

- Follow along with your starter code notebook while I walk through these examples.
- The first plot shows a relationship between two values, though not a linear solution.
- Note that lmplot() returns a straight line plot.
- However, we can transform the data, both log-log distributions to get a linear solution.

# USING SEABORN TO GENERATE SIMPLE LINEAR MODEL PLOTS

#### **ACTIVITY: GENERATE SINGLE VARIABLE LINEAR MODEL PLOTS**

#### **DIRECTIONS (15 minutes)**

1. Update and complete the code in the starter notebook to use **Implot** and display correlations between body weight and two dependent variables: **sleep\_rem** and **awake**.

#### **DELIVERABLE**

Two plots

#### INTRODUCTION

## SIMPLE REGRESSION ANALYSIS IN SKLEARN

#### SIMPLE LINEAR REGRESSION ANALYSIS IN SKLEARN

- Sklearn defines models as *objects* (in the OOP sense).
- You can use the following principles:
  - All sklearn modeling classes are based on the <u>base estimator</u>. This means all models take a similar form.
  - -All estimators take a matrix  $\mathbf{X}$ , either sparse or dense.
  - ightharpoonup Supervised estimators also take a vector  $\mathbf{y}$  (the response).
  - •Estimators can be customized through setting the appropriate parameters.

#### **CLASSES AND OBJECTS IN OBJECT ORIENTED PROGRAMMING**

- **Classes** are an abstraction for a complex set of ideas, e.g. *human*.
- Specific **instances** of classes can be created as **objects**.
  - •john\_smith = human()
- Objects have **properties**. These are attributes or other information.
  - •john\_smith.age
  - •john\_smith.gender
- Object have **methods**. These are procedures associated with a class/object.
  - •john\_smith.breathe()
  - •john\_smith.walk()

#### SIMPLE LINEAR REGRESSION ANALYSIS IN SKLEARN

General format for sklearn model classes and methods

```
# generate an instance of an estimator class
estimator = base_models.AnySKLearnObject()
# fit your data
estimator.fit(X, y)
# score it with the default scoring method (recommended to use the metrics module in the future)
estimator.score(X, y)
# predict a new set of data
estimator.predict(new_X)
# transform a new X if changes were made to the original X while fitting
estimator.transform(new_X)
```

- LinearRegression() doesn't have a transform function
- With this information, we can build a simple process for linear regression.

### SIGNIFICANCE IS KEY

#### **DEMO: SIGNIFICANCE IS KEY**

- Follow along with your starter code notebook while I walk through these examples.
- What does the residual plot tell us?
- How can we use the linear assumption?

#### **GUIDED PRACTICE**

## USING THE LINEAR REGRESSION OBJECT

#### **ACTIVITY: USING THE LINEAR REGRESSION OBJECT**

#### **DIRECTIONS (15 minutes)**

- 1. With a partner, generate two more models using the log-transformed data to see how this transform changes the model's performance.
- 2. Use the code on the following slide to complete #1.

#### **DELIVERABLE**

Two new models

#### **ACTIVITY: USING THE LINEAR REGRESSION OBJECT**

#### **DIRECTIONS (15 minutes)**

```
X =
y =
loop = []
for boolean in loop:
    print 'y-intercept:', boolean
    lm =
linear_model.LinearRegression(fit_intercept=boolean)
    get_linear_model_metrics(X, y, lm)
    print
```

#### **DELIVERABLE**

Two new models

#### INDEPENDENT PRACTICE

## BASE LINEAR REGRESSION CLASSES

#### **ACTIVITY: BASE LINEAR REGRESSION CLASSES**

#### **DIRECTIONS (20 minutes)**

- Experiment with the model evaluation function we have (get\_linear\_model\_metrics) with the following sklearn estimator classes.
  - a. linear\_model.Lasso()
  - b. linear\_model.Ridge()
  - c. linear\_model.ElasticNet()

**Note**: We'll cover these new regression techniques in a later class.

#### **DELIVERABLE**

New models and evaluation metrics

#### INTRODUCTION

## MULTIPLE REGRESSION ANALYSIS

#### **MULTIPLE REGRESSION ANALYSIS**

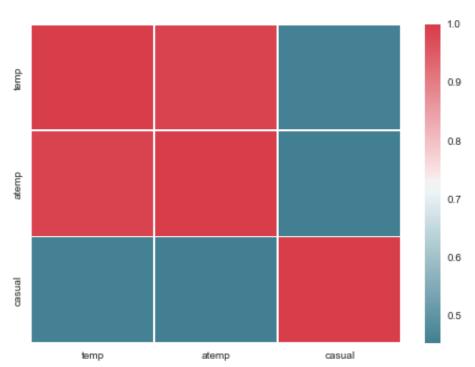

- Simple linear regression with one variable can explain some variance, but using multiple variables can be much more powerful.
- We want our multiple variables to be mostly independent to avoid multicollinearity.
- Multicollinearity, when two or more variables in a regression are highly correlated, can cause problems with the model.

#### **BIKE DATA EXAMPLE**

 We can look at a correlation matrix of our bike data.

• Even if adding correlated variables to the model improves overall variance, it can introduce problems when explaining the output of your model.

• What happens if we use a second variable that isn't highly correlated with temperature?

# MULTICOLLINEARITY WITH DUMMY VARIABLES

#### **ACTIVITY: MULTICOLLINEARITY WITH DUMMY**

#### **VARIABLES**

#### **DIRECTIONS (15 minutes)**

- 1. Load the bike data.
- 2. Run through the code on the following slide.
- 3. What happens to the coefficients when you include all weather situations instead of just including all except one?

#### **DELIVERABLE**

Two models' output

#### **ACTIVITY: MULTICOLLINEARITY WITH DUMMY**

#### **VARIABLES**

#### **DIRECTIONS (15 minutes)**

```
lm = linear_model.LinearRegression()
weather = pd.get_dummies(bike_data.weathersit)
get_linear_model_metrics(weather[[1, 2, 3, 4]], y, lm)
print
# drop the least significant, weather situation = 4
get_linear_model_metrics(weather[[1, 2, 3]], y, lm)
```

#### **DELIVERABLE**

Two models' output

#### **GUIDED PRACTICE**

## COMBINING FEATURES INTO A BETTER MODEL

#### **ACTIVITY: COMBINING FEATURES INTO A BETTER MODEL**

#### **DIRECTIONS (15 minutes)**

- 1. With a partner, complete the code on the following slide.
- 2. Visualize the correlations of all the numerical features built into the dataset.
- 3. Add the three significant weather situations into our current model.
- 4. Find two more features that are not correlated with the current features, but could be strong indicators for predicting guest riders.

#### **DELIVERABLE**

Visualization of correlations, new models

#### **ACTIVITY: COMBINING FEATURES INTO A BETTER MODEL**

#### **DIRECTIONS (15 minutes)**

```
lm = linear_model.LinearRegression()
bikemodel data = bike data.join() # add in the three weather situations
cmap = sns.diverging_palette(220, 10, as_cmap=True)
correlations = # what are we getting the correlations of?
print correlations
print sns.heatmap(correlations, cmap=cmap)
columns_to_keep = [] #[which_variables?]
final_feature_set = bikemodel_data[columns_to_keep]
get linear model metrics(final feature set, y, lm)
```

#### **DELIVERABLE**

Visualization of correlations, new models

#### INDEPENDENT PRACTICE

# BUILDING MODELS FOR OTHER Y VARIABLES

#### **ACTIVITY: BUILDING MODELS FOR OTHER Y**

#### **VARIABLES**

#### **DIRECTIONS (25 minutes)**

- 1. Build a new model using a new y variable: registered riders.
- 2. Pay attention to the following:
  - a. the distribution of riders (should we rescale the data?)
  - b. checking correlations between the variables and y variable
  - c. choosing features to avoid multicollinearity
  - d. model complexity vs. explanation of variance
  - e. the linear assumption

#### **BONUS**

- 1. Which variables make sense to dummy?
- 2. What features might explain ridership but aren't included? Can you build these features with the included data and pandas?

#### **DELIVERABLE**

A new model and evaluation metrics

#### CONCLUSION

### TOPIC REVIEW

#### CONCLUSION

- You should now be able to answer the following questions:
  - •What is simple linear regression?
  - •What makes multi-variable regressions more useful?
  - •What challenges do they introduce?
  - •How do you dummy a category variable?
  - •How do you avoid a singular matrix?
